

Contrast P3 – P1, estimand full: four operationalisations, each on its own scale

Panels use different scales: each procedure has its own unit.

Magnitudes are not compared across procedures — what is compared is the sign and whether the interval covers zero.

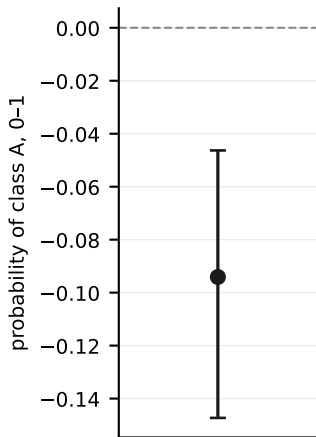

The value shown is the raw metric; the line “sign after convention” refers to the general reading rule “higher means more AI-like” and for procedure 3 does not match the sign of the raw value.

1. style index score-v2

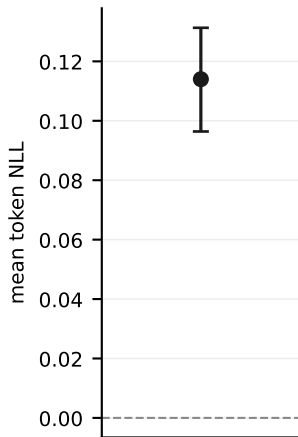

-1.766 p = 0.0004
sign after convention: -

2. classifier P2b

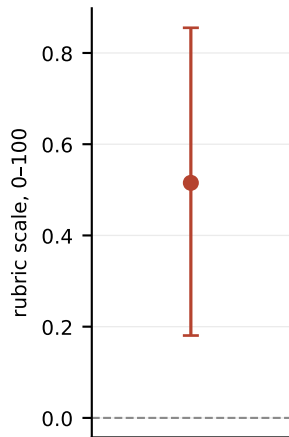

-0.0941 p = 0.0028
sign after convention: -

3. zero-shot nll-v2

+0.114 p = 0.0004
sign after convention: -

4. judge model judge-v2

+0.5153 p = 0.0032
sign after convention: +
